

Fig. 4. Stratigraphic range chart for foraminifers and miscellaneous shelly microfossils on Haltenbanken. The average stratigraphic range is in solid, local extensions upward and downward in wells (shown dashed); fully dashed ranges are tentative. The same North Sea foraminiferal zonation of Fig. 2, albeit less detailed, applies to the Haltenbanken area; Lower Palaeocene strata are absent in the wells examined. *Dorothy seiglieri*, *Reticulophragmium jarvisi*, *Karreriella conversa*, and *Cystammina* spp. have different local ranges from those of the North Sea.

Frequent hiatus, see text
